Performance-Based Funding: The National Landscape

Janice Nahra Friedel and Zoë Mercedes Thornton, Iowa State University
Mark M. D’Amico, The University of North Carolina at Charlotte
Stephen G. Katsinas, The University of Alabama

INTRODUCTION

On August 22, 2013, in his speech at the University of Buffalo, President Barack Obama squarely placed the issue of college affordability and performance metrics on the nation’s agenda. “I think we should rate colleges based on opportunity. Are they helping students from all kinds of backgrounds succeed — (applause) — and on outcomes, on their value to students and parents.” (Obama, 2013).

The president’s remarks will undoubtedly spur increased attention to performance metrics. In his speech, he called for metrics like “How much debt does the average student leave with? How easy it is to pay off? How many students graduate on time? How well do those graduates do in the workforce? Because the answers will help parents and students figure out how much value a college truly offers.” (Obama, 2013).

This issue brief provides an up-to-date analysis of the current status of performance-based funding in the fifty states and the District of Columbia. It includes a section on the historical context of performance-based funding (PBF), with emphasis on community colleges, the sector of U.S. higher education that appears to have seen the most state-level legislation in recent years. A discussion of early efforts at PBF that date to the late 1970s is presented, as well as PBF 2.0 and more recent efforts spurred by the National Governors Association and other groups, particularly the philanthropic foundations and their funded advocacy groups. The issue brief concludes with discussion as to whether it works and lessons learned.

Performance-Based Funding, The National Landscape

In the twentieth century, the United States, with the world’s most highly educated citizenry, attained global economic and political prominence. Today, this global ranking has been displaced, as the proportion of the U.S. population age 25–34 with an associate degree or higher has dropped to 41% (OECD, 2011) (See Figure below). Current U.S. national policy reflects the realization that reclaiming our prominence in the global economy can only be accomplished with an educated and technologically savvy workforce.

In a direct response to this critical need, President Obama (2009) announced his goal for the United States to have “the best educated, most competitive workforce in the world.” The centerpiece of Obama’s 2020 Goals include increasing the number of college graduates, with all Americans completing at least one year of college. The college completion focus is both a workforce and an economic development issue and, as such, has shifted attention to postsecondary education. The 2020 goals are incorporated in the White House Completion Initiative which includes measuring progress on five indicators: college costs, graduation, student loan repayment, student loan debt, and earnings potential (Kanter, 2012). The demand for higher college completion rates comes at a time when public colleges and universities are facing several issues in direct competition to their goals: state appropriations cuts, increasing numbers of at-risk (underprepared, low-income, and/or non-traditional) students, decreasing student financial aid, and rising tuition (AASCU State Relations and Policy Analysis Team, 2013; Harnisch, 2011a; Mortenson, 2010).

Many states have increased oversight of public higher education through accountability initiatives (National Conference of State Legislatures, 2013) even while resources allotted to the institutions have declined (National Governors Association and the National Association of State Budget Officers, 2012). The traditional

Increasing degree completion at America’s public colleges and universities is pivotal for the nation’s economic competitiveness and long-term economic growth. To meet this goal in a time of unprecedented fiscal strain, policymakers and higher education leaders need comprehensive, consistent performance metrics to shape funding strategies and pinpoint areas for improvement.

– National Governors Association Work Group on College Completion. (Reyna, 2010, p. 5)

method for measuring success and providing state funding to public colleges has relied primarily on enrollment thus ensuring a focus on accessibility; however, the enrollment-based model is limited and does not align with the current national agenda for increasing the number of college graduates. The challenge has now become finding a formula to “shift incentives away from the costs of educational inputs toward stronger performance outputs, while still maintaining strong student access to education,” (New Mexico Higher Education Department, 2011, p. 1).

One option for state-level response to current national agendas is the introduction of performance-based funding models within higher education policy. Currently being utilized by twenty-three states (with more transitioning to or involved in formal discussions) (See Figure 2), performance-based funding extends beyond enrollment to include incentives for productivity and completion (or transfer) (Harnisch, 2011a; NCSL, 2013). Simply defined, performance-based funding (PBF) “rewards institutions that meet state goals…is based on outputs instead of inputs,…(and) the more goals that institutions meet, the more funding they receive,” (Blankenberger, 2011, slide 12). As the demand for greater responsiveness to the state’s educational and workforce needs increases, PBF policies aligned with the state’s agenda for higher education offer a way to begin meeting this demand.

What is PBF?

Unlike performance-based budgeting which utilizes performance indicators, among other factors, to influence funding decisions, performance-based funding relies on a formula which utilizes performance indicators to decide actual funding amounts (Dougherty & Hong, 2005; Rabovsky, 2012). Specifically, some portion of state allocations is awarded based on institutional outcomes. Thus, performance-based budgeting is indirectly tied to funding, while performance-based funding (PBF) is directly tied to funding as “a system based on allocating a portion of a state’s higher education budget according to specific performance measures,” (Miao, 2012, p. 1).

Harnisch (2011a), referring to resource dependency theory (Pfeffer & Salancik, 1978), states that “leaders of public colleges and universities are significantly dependent on state...
A number of states, including Tennessee, are taking innovative steps to reduce college costs by tying state aid to graduation rates and other measures. But Washington needs to be careful about taking a good idea for one state and forcing all 6,000 institutions of higher education to do the exact same thing, turning Washington into a sort of national school board for our colleges and universities.”

—Senator Lamar Alexander (R-TN)

“...and such, they will take the measures necessary to retain or enhance their institutions’ funding” (p. 2). States utilizing the PBF model seek to influence institutional change toward improving performance through funding incentives (Harnisch, 2011a; Rabovsky, 2012). Miao (2012) has identified three models of PBF currently in use by states: output-based funding formula, performance set-asides, and performance contracts.

Output-based funding formulas provide fiscal incentives for positive improvement in specific metrics. This model is utilized within the state funding formula, as a portion of the annual base appropriations. Often weighted for institutional mission, this model allows community colleges to increase their total appropriations through improved performance on identified metrics. Performance set-asides reserve a percentage of the state funding to be awarded to high performing institutions. The set-aside dollars may be a portion of the annual base appropriation or separate bonus funding. Community colleges compete with each other for the set-aside funding by achieving a targeted measure of performance set prior to the year. Performance contracts between the individual community college and the state provide a third option for PBF models. Through this model, funding is awarded if the community college meets the agreed upon performance goals set forth in the contract (Miao, 2012).

Using a specified percentage of state appropriations (generally 1-25%) PBF is awarded based on the outcomes of certain performance indicators that reflect institutional progress toward both institutional mission and state goals (Harnisch, 2011a). As a results-based model, PBF considers success through outcomes (such as credit completion), as opposed to inputs (credit enrollment). Current PBF models incorporate indicators of at least two types: general outcomes and progress outcomes (Harnisch, 2011a; Miao, 2012). Depending on state priorities, subgroup outcome indicators and high-need subject outcome indicators may be included, as well (Harnisch, 2011a). Previous literature (Dougherty & Reddy, 2011; Harnisch, 2011a; Miao, 2012; NCSL, 2013; WHECB, 2011) indicates higher education performance-based measures have evolved over time to include indicators such as:

**Types of Performance Indicators: Current as of August 13, 2013**

- **General outcome indicators:** graduation rate, number of degrees/certificates awarded, number of degrees/certificates awarded per FTE, research or grant funding awarded, job placement rates, student success on licensing exams;
- **Progress outcome indicators:** number of students completing 12, 24, 48 and 72 semester credits, developmental course completion, number of students who transfer to a four-year institution after completing 12 credits, dual enrollment credit completion;
- **Subgroup outcome indicators:** low-income status, at-risk status, Pell Grant recipients, nontraditional students, first-generation students, minority group identification;
- **High-need subject outcome indicators:** STEM fields, nursing, job placement rates in high-need fields.

Current performance-based measures have moved beyond enrollment and graduation to include transfer, developmental education and STEM-related coursework. Additionally, the formulas may be weighted for marginalized populations, including low-income, adult, and at-risk students. By assigning a weight to certain indicators, policymakers signal the specific importance or additional challenge identified with those particular indicators. For instance, most states provide additional weight for the progress and...
completion of low-income students within the PBF formula, recognizing the additional barriers these students face when seeking degrees. Weighting certain indicators in the PBF formula is also useful for recognizing the unique features of institutional mission (Miao, 2012).

**Contextual Considerations for Community Colleges**

Policymakers and other stakeholders are increasingly calling for greater transparency and accountability of higher education (Trettel & Yeager, 2011). Both the Lumina Foundation (through Complete College America) and the Gates Foundation (with Completion by Design) have national goals and initiatives addressing college student success, persistence, and completion. The 2009 strategic plan of the Lumina Foundation has the goal of increasing the percentage of Americans who hold high quality degrees and credentials to 60% by 2025 (Kelderman, 2013). Additionally, President Obama’s American Graduation Initiative calls for 5 million additional college graduates by 2020 (Kanter, 2012).

The National Governors Association’s Compete to Complete plan recommends outcome and progress metrics to be measured and compared across the states. These metrics include degrees awarded, graduation and transfer rates, enrollment and success in developmental education, retention rates, credits earned, and time and credits to degree (Reyna, 2010). In direct alignment of this national agenda, the state-level PBF model rewards community colleges for improving progression toward completion.

In a recent report from the 21st Century Commission on the Future of Community Colleges, the American Association of Community Colleges (2012) notes that in addition to “student success rates that are unacceptably low,” community colleges are “historically underfunded” by funding formulas “that encourage enrollment growth...without adequately supporting that growth, and largely without incentives for promoting student success,” (p. viii). The Commission’s report identifies a framework for adapting

---

**Outcome Metrics**

The outcome metrics quantify the end-product of the educational process, informing policymakers and the public on how students, institutions, and the state are performing on the goal of increased postsecondary attainment.

- Degrees Awarded
- Graduation Rates
- Transfer Rates
- Time and Credits to Degree

---

**Progress Metrics**

Progress metrics measure student movement from semester-to-semester and year-to-year toward the completion of an academic program. Such measures help policy makers identify specific challenges and opportunities for improvement in higher education.

- Enrollment in Remediation Education
- Success in Remediaional Education
- Success in First Year College Courses
- Credit Accumulation
- Retention Rates
- Course Completion
community colleges to the needs of the 21st-Century, including a shift in focus from access to one on access and success, as well as enhancing decision-making through a culture of evidence. Specifically, the Commission calls for a shift from “funding tied to enrollment” to “funding tied to enrollment, institutional performance, and student success” (AACC, 2012, p. 14).

As community college appropriations are declining (or frozen) in many states and tuition continues to rise, PBF policies can provide an opportunity to tie outcomes to funding. By aligning PBF with the state’s agenda for higher education, legislators may become more committed to avoiding cuts to community college appropriations during tight budget years. This may provide the colleges a greater level of trust in the legislative appropriations process, and greater control over the potential amount of funding received.

**Historical Perspective on PBF**

Performance-based funding was first introduced to higher education as a funding initiative by the Tennessee Higher Education Commission in 1978. After a slow start, this new policy option quickly spread across the nation, with 26 states utilizing PBF policies at some point by mid-2000 (Harnisch, 2011a; Rabovsky, 2012). Many of these early policies were attached to “new money,” so as the economy declined and state budgets began to be cut, PBF was often among the first programs to be eliminated (Harnisch, 2011a).

What went wrong with early PBF models?

Although PBF models have been in use since 1978, there are distinct differences in the design of current models (often referred to as PBF 2.0) from the early models (now referred to as PBF 1.0). Most models through the early 2000’s emphasized outcomes measures such as completion and transfer, with only minor attention to progress measures, such as retention. Often designed without input from higher education leaders, 1.0 models frequently disregarded institutional goals and mission, and emphasized completion over progression (Dougherty & Reddy, 2011; Miao, 2012). Instead of being a percentage of the base appropriations, PBF 1.0 funding was usually a bonus (often new money) and the first to be cut during budget crunches (Dougherty & Reddy, 2011). Without significant and solid funding attached, many PBF 1.0 models failed to incentivize change for institutions. Many of the 1.0 models faced difficulties and were allowed to lapse (Miao, 2012).

**What is PBF 2.0?**

In spite of deficiencies with past models of performance-based funding, a renewed interest has been sparked in examining the benefits of tying institutional performance to state appropriations. Seeking to improve upon past models, lawmakers of several states have put forth efforts to research PBF and create updated models to meet the current educational and workforce needs of the state (Harnisch, 2011b).

Often referred to as PBF 2.0, these newer versions seek to improve upon the negative aspects of previous attempts to influence performance at the state level. One key failure of past models was the exclusion of the stakeholders in the planning phases, particularly community college leadership. Thus, an important characteristic of the 2.0 model is a joint planning process by which policymakers and other constituents ensure that the PBF plan aligns with the state’s agenda for higher education, while providing alignment with institutional priorities (Blankenberger, 2011; Miao, 2012; Shulock, 2011).

A key component of current PBF 2.0 models is the alignment with the state’s priorities for higher education. Thus, the state and the community college partner to achieve an improved workforce and economy for the state’s future. Included in the 2.0 model is the acknowledgment of individual institutional mission (Blankenberger, 2011). The goal of PBF 2.0 is not to influence change on a community college’s mission, but instead to incentivize progress toward those components of the institutional mission that
“A core principal of higher education finance is that funding formulas must be systematically aligned with the goals and priorities of the state in order for colleges and universities to have the incentives and resources they need to achieve the targets set for them.”

align with the state’s priorities and needs (Harnisch, 2011a).

Another component of several PBF 2.0 policies addresses the implementation of the plan, often allowing for a “learning year” in which the indicators are measured and the state provides feedback on the outcomes (Dougherty, Natow, Hare, & Vega, 2010; Miao, 2012). There is no actual funding attached to the indicators during this first year. Whether the PBF plan includes a “learning year” or not, gradual implementation allows institutions to adjust their data collection and reporting processes accordingly and prevents any major funding losses. Some states also include a stop gap, or stop loss, mechanism during the first years, which also prevents major funding losses or colleges falling too far behind in the process (Miao, 2012; Shulock, 2011). We refer to the combination of transition strategies as a “soft landing.”

While previous PBF plans (1.0 models) often limited performance measures to ultimate outputs (graduation or transfer rates), PBF 2.0 models include intermediate measures as well (Blankenberger, 2011; Miao, 2012; Shulock, 2011). These include developmental education completion, progress indicators (such as completion of 12 and 24 credits), and retention indicators (such as fall to spring or fall to fall enrollment). Additionally, PBF 2.0 aims to ensure the continued access and equity of community colleges through enhanced incentives for serving at-risk, under-prepared, and other marginalized populations through weighted formulas (Blankenberger, 2011; Miao, 2012; Shulock, 2011). Encouraging performance improvement over time within a community college, instead between colleges, increases the opportunity for closing specific performance gaps (Shulock, 2011).

Just as important as determining and defining the PBF measures, the state must also define the actual funding assigned to the measures; specifically, the percentage to be appropriated, what dollars will be used (new or established) and whether the funding will be in addition to or a portion of the annual base appropriations. While earlier versions of PBF provided a small bonus above the state’s base appropriations, newer versions utilize a percentage of the base to influence performance (Dougherty & Reddy, 2011).

Which States are Utilizing PBF Today?

When examining the status of PBF model implementation across the states, one concludes that the national landscape is in a state of flux; as such, the status report given in Figure 4 is noted to be “a point in time” report. Some states are revamping their PBF to the PBF 2.0 model; others are moving into the PBF policy arena for the first time and having learned from the lessons from other states are incorporating elements of PBF 2.0. Using the National Council of State Legislatures (NCSL) State Activity Table (NCSL, 2013) as a guide, the authors conducted a review of state legislative and higher education agencies and governing board websites, searching for updates and new developments. A draft of an updated PBF State Activity Table was circulated at the 2013 annual summer meeting of the National Council of State Directors of Community Colleges. Table 2 summarizes these results. The authors made every attempt to accurately list sector-specific measures for PBF states, which is why some states have measures for universities, others for community colleges, and others for both sectors.

Based on these various sources, as of August 15, 2013, we conclude that 39 states are active in PBF: 23 states currently have funding formulas in
place which directly relate some portion of the state appropriations to institutional performance: Arizona, Arkansas, Illinois, Indiana, Louisiana, Massachusetts, Michigan, Minnesota, Mississippi, Missouri, Nevada, New Mexico, North Dakota, Ohio, Oklahoma, Oregon, Pennsylvania, South Dakota, Tennessee, Texas, Utah, Virginia, and Washington. Six states are transitioning to PBF formulas: Alabama, Colorado, Florida, Montana, North Carolina, and Wyoming, while 10 more states are currently in formal discussions regarding this funding option: California, Georgia, Idaho, Kentucky, Maine, Maryland, New York, South Carolina, Wisconsin and West Virginia. The status of PBF in three states is briefly described below, Tennessee, Washington, and Ohio. These states were chosen for discussion due to their history with PBF, the evolution of the model in their state, and the lessons learned from their implementation with PBF.

**Tennessee**

Introducing the first PBF system in 1978 (Harnisch, 2011a), Tennessee has the longest running record of PBF efforts but has also revised its model eight times (Sanford & Hunter, 2011). Prior to 2010, PBF held for only a small portion of the total state appropriations (ranging from 2%-5.45% of the base), while the bulk of the funding continued to be allocated on institutional enrollment (Dougherty & Reddy, 2011; Harnisch, 2011a). Examining Tennessee’s retention and graduation rates, Sanford and Hunter (2011) found that PBF did not result in improved outcomes at the public four-year universities; additionally, they found that increasing the funds tied to performance from 2% to 5% did not result in any further improvements in performance. In a separate study of PBF in Tennessee, Bogue and Johnson (2010) found a slight uptick in graduation rates in the two- and four-year higher education institutions. These results may have led legislators to recognize as Miao (2012) did that PBF amounts must be significant enough to incentivize efforts for improved outcomes. Tennessee has recently taken a bold step towards a complete outcome-based system, foregoing enrollment as a measurement for funding altogether.

Tennessee’s PBF model provides a distinct example of the 2.0 model through the use of stakeholder collaboration, institutional mission acknowledgment, alignment with state priorities, measuring progress and completion, and the use of stable funding through base appropriations. Utilizing separate formulas to recognize differing missions, the state’s universities and community colleges report on slightly different performance indicators. The university indicators include credit accumulation, degree completion, research and grant funding, transfers out, and six-year graduation rate. The community college indicators include credit accumulation, dual enrolled students, degree completion, job placement, developmental education progression, transfers out, and workforce training (Dougherty & Reddy, 2011; NCSL, 2013). Additionally, nontraditional and low-income students are more heavily weighted within the formula (NCSL, 2013). With 100% of state appropriations soon to be dependent upon performance (NCSL, 2013), Tennessee’s institutions are responding with strategies to improve retention and completion, including additional advisors, increased tutoring and developmental courses, and fast-track courses and programs (Harnisch, 2011a).

**Washington**

After a short three-year stint, Washington state legislators allowed their first PBF system to lapse in 1999. Their first system utilized separate groups of indicators for the universities and the community colleges, and awarded a small percentage of the base state appropriations that was held back and reassigned as PBF (Dougherty & Reddy, 2011).

The state’s current PBF system combines 1.0 and 2.0 model practices for a performance set-aside system called “Achievement Points” (Harnisch, 2011a) under the Student Achievement Initiative established in 2007 by the State Board for Community and Technical Colleges (Dougherty & Reddy, 2011). Utilizing new money, the system incentivizes certain outcomes by awarding additional funding “based on their accumulation of momentum points,” (NCSL, 2013, para.
32). These are earned through several indicators, including basic skills and developmental education, credit accumulation, college-level math course completion, apprenticeship training, and degree and certificate completion (Albright, 2009; Dougherty & Reddy, 2011; NCSL, 2013). Incorporated into the system was a learning year, which allowed the community colleges the opportunity to examine their performance the first year without attached funding (Dougherty & Reddy, 2011). Although Washington uses a bonus funding model (1.0), the state has incorporated 2.0 model practices with the measurement of both progress and completion, as well as the learning year during the initial stage. Since its establishment in 2007, this PBF model appears to have increased performance in each of the indicator categories (Harnisch, 2011a).

Ohio
Ohio introduced separate 1.0 PBF models for the public universities and community colleges in 1995, each of which awarded a small bonus for transfer and completion rates. Beginning in 2010, state legislation began phasing in a new system for PBF by incorporating 2.0 model practices, effectively ending enrollment-based funding for the universities (Dougherty & Reddy, 2011, NCSL, 2013). The current university PBF model awards 100% of the state appropriations based on course and degree completion, with the degree component being phased in over the course of several years. This funding is weighted for the costs of programs and low-income students (Albright, 2009; Dougherty & Reddy, 2011). Beginning in 2011, community colleges received up to 5% of their state appropriations through the new PBF model; this amount is gradually being increased each year to 30% of the total appropriations by fiscal year 2015 (Dougherty & Reddy, 2011). The community college performance indicators include progression through a sequence of developmental coursework to college credit coursework, accumulation of credits, degree completion, and transfers to four-year institutions. Both PBF models include a stop-loss provision to prevent any institution losing more than 1% of their base funding, however this will eventually be phased out (NCSL, 2013).

Does PBF Work?
Although PBF models have been utilized in some form for the past 30 years, there are mixed reviews on their success. While little research has been completed on the overall effects of current PBF models, there have been several observations (e.g., Bogue & Johnson, 2010; Sanford & Hunter, 2011). These early results (Dougherty & Reddy, 2011; Harnisch, 2011a) propose multiple benefits to the individual student, the college, and the state, including:

- Increased awareness and alignment of the institutional mission and goals with the state’s agenda and expectations;
- Increased college self-awareness of actual outcomes (both intermediate and ultimate);
- Increased healthy competition between colleges based on publication of outcome measures;
- Increased use of data during institutional planning and decision making.

Disadvantages of PBF models include the possibility that the chosen indicators measure only a portion of the entire institutional picture, and that the potential exists for negative effects on institutional quality, access, equity, mission, or stability (Harnisch, 2011a). In fact, the California nonpartisan Legislative Analyst’s Office reviewed a recent PBF proposal to fund community colleges based on course completion and noted their concern that the governor’s proposal to move the census date could consequently result in grade inflation or jeopardize course rigor, recommending instead the development of a model that balances both access and success (LAO, 2013). Additionally, college and university leaders in Texas have expressed concern that PBF models may cause an additional loss of funds, as well as disregard institution-specific factors, such as student populations (Cardona, 2013).

While PBF 2.0 considers improvement within intermediate outcomes, the ultimate goal of this funding model is to increase the number of college graduates with the qualifications to address current workforce needs within the state. However, the current literature reflects a strong perspective that without significant state dollars committed to PBF,
there will be little direct impact on the ultimate desired outcome of increased graduation rates (Rabovsky, 2012).

**Lessons Learned**

Several points are important for consideration when designing PBF models for higher education: the relationship between PBF and strategic planning for institutional and state-level futures, the importance of the use of benchmarks, the involvement of stakeholders in development, and the use of an oversight office or agency for evaluation (Melkers & Willoughby, 1998). Additionally, the dollars attached to PBF must be sufficient to incentivize institutions (Miao, 2012). The lessons learned from early PBF1.0 models will impact the design and success of the 2.0 model, as well as help alleviate concerns of colleges and universities.

Community college leaders in several states with PBF appear supportive of the system (Dougherty et al., 2010); however, this may be attributed to their need for additional state funding and acceptance of processes for new funding streams. While state officials are most often the proponents of PBF options (Dougherty et al., 2010), significant involvement from institutions will ensure their unique perspective and needs are represented in the model, and that the chosen indicators will accurately reflect performance and improvement (Harnisch, 2011a; Miao, 2012; Shulock, 2011). An important factor in planning and designing the PBF system includes input from the various stakeholders (Dougherty et al., 2010; Harnisch, 2011a; Miao, 2012; NCSL, 2013; WHECB, 2011). The design process should involve policymakers, higher education leaders, faculty, business leaders, education organizations and others who may have a vested interest in higher education productivity and finance reform. To ensure continued equity and access to higher education, Dougherty et al. (2010) also suggest the inclusion of minority and social-equality groups during the planning process.

Extremely important is the alignment of the PBF system with the state’s goals and agenda for higher education with the state’s workforce and economic development priorities (Harnisch, 2011a; Miao, 2012; WHECB, 2011). Without guidance on the vision of the state and its workforce and economic development needs, public higher education cannot truly serve as a tool for the state to advance on its goals. Successful PBF models measure performance indicators related to the goals of the institution, which in turn support the state’s public agenda (Harnisch, 2011a; Shulock, 2011). Blankenberger (2011) notes that at the core of its purpose, PBF “rewards institutions that meet state goals,” (slide 12).

Institutional mission and characteristics should be taken into account within the PBF model (Harnisch, 2011a; Miao, 2012; NCSL, 2013; WHECB, 2011). Utilizing different performance measures for certain institutions will prevent PBF from hindering or altering the mission, access or equity of a college or university. In particular, community colleges and four-year universities have distinctly different missions and goals. PBF formulas and the indicators selected to measure performance and improvement must accurately represent each institutional type. Additionally, the funding formula should include weighting for marginalized populations, by providing incentives for progression and completion by academically and/or financially at-risk students. This ensures continued access and equity (Blankenberger, 2011; Shulock, 2011; WHECB, 2011). Finally, a key component of current, successful PBF models is the inclusion of both progression (retention) and completion indicators.

Very important to the success of PBF systems is the commitment of stable funding streams, with enough dollars to create significant interest for change (Harnisch, 2011a; Miao, 2012; Rabovsky,
A recent study examined the effectiveness of PBF policies on institutional spending, finding minimal change attributed to these policies (Rabovsky, 2012). Referring to the casual logic of PBF, Rabovsky (2012) examined whether institutions responded to funding incentives with new spending practices aimed at improving retention and completion. Interestingly, Rabovsky (2012) noted that the minimal level of influence discovered at the institutional level may, in fact, be attributed to the small percentage of state appropriations most PBF models currently utilize. There exists “the potential for these policies to have considerable effects on administrative behavior if policymakers could more effectively tie larger incentives to institutional performance,” (Rabovsky, 2012, p. 694). As such, state funding dollars designated as PBF provide an incentive for improvement when they are provided as additional funds, beyond the yearly appropriation. Additionally, these funds should be solid, with a low risk of being reduced or removed in future years. The threat of impending reduction only serves to elicit distrust from the colleges and universities and hinders the intentions of measuring and encouraging increased effectiveness.

A great concern of institutions facing new PBF systems is the possibility of dramatic losses of funding during the initial years. This concern can be put at ease by gradually phasing in the new system over a few years and by incorporating a stop-loss gap provision (Miao, 2012; Shurlock, 2011), through the “soft landing” philosophy. The assurance that funding will not drop below a certain percentage can provide some positive light on the new PBF system. Additionally, by utilizing the first year as a learning year, institutions will have the opportunity to examine their actual performance outcomes and begin making changes before funding is at stake (Harnisch, 2011a; Miao, 2012).

Finally, the PBF system should be continuously evaluated for success and improvement (Harnisch, 2011a; Miao, 2012). Certain factors may influence the continuous improvement of particular measures, causing the need to modify or change the use of those indicators within the formula. Similarly, an institution may begin adapting its practices to meet performance requirements, while inadvertently creating negative effects on students. These are both examples of the need for continuous monitoring and evaluation of PBF systems, as well as the need for flexibility.

**Conclusion**

The prevalence of performance-based funding models has increased recently, in conjunction with the national college completion agenda and the unfortunate decline in state appropriations. It is important to note that PBF is not the answer to the larger issue of declining support and funding for higher education, and thus should not be used to meet the greater funding issues of higher education. While there is not compelling evidence of the link between PBF and improved student outcomes at this time, states that are considering PBF should at least consider the following:

<table>
<thead>
<tr>
<th>Policy Recommendations</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. Engage stakeholders in the discussion and planning, including legislators, college leaders and business and industry representatives;</td>
</tr>
<tr>
<td>2. Align the measures of the PBF model with state goals, particularly workforce and economic development goals;</td>
</tr>
<tr>
<td>3. Allow for the differentiation of institutional missions;</td>
</tr>
<tr>
<td>4. Plan to phase in the new PBF model and funding, and include a “soft landing” (i.e., learning year) for measurement only;</td>
</tr>
<tr>
<td>5. Commit significant state dollars to incentivize the PBF system;</td>
</tr>
<tr>
<td>6. Include both outcome and progress performance measures.</td>
</tr>
<tr>
<td>7. Continuously evaluate the PBF System.</td>
</tr>
</tbody>
</table>

As an alternative to incremental increases in enrollment-driven funding, a PBF model provides an opportunity for increased accountability for ensuring quality and meeting state needs. State legislators considering PBF are advised to study its limitations, advantages and disadvantages, and to consider the lessons learned from the states that have implemented PBF.

The PBF State Activity Table is based on the February 2013 version developed by the National Conference of State Legislatures (NCSL) and has been modified and included with permission from NCSL: http://www.ncsl.org/issues-research/educ/performance-funding.aspx The current table includes updates by the authors from the state legislative websites, websites of state higher education agencies and governing boards, and community college state directors in attendance at the annual summer meeting of the National Council of State Directors of Community Colleges, July 28-31, 2013, Big Sky, MT.

About the Education Policy Center at The University of Alabama

The Education Policy Center provides policy-related analyses in support of access, equity, and economic and community development to the benefit of our public schools, community and technical colleges, and four-year colleges and universities. The Center accomplishes its work through a dynamic research and policy agenda that, through active dissemination, seeks to inform and improve policy-making and practice at the national, state and local levels. Our coordinated program of basic and applied research deploys our extensive background in historical and topical analyses of education-related issues to the benefit of education practitioners and policy-makers in the State of Alabama, the South, and the nation. Stephen G. Katsinas is director of the Center; his research interests are in higher education and State and Federal policy, and access and finance issues for both two- and four-year institutions. Associate director Wayne Urban, a historian of elementary and secondary education on the U.S., recently authored the book More Science or Sputnik: The National Defense Education Act of 1958, and has written about No Child Left Behind and charter schools. The Center hosts The University of Alabama’s Superintendents Academy under the leadership of Richard L. Rice Jr. The Center’s work is assisted by Senior Fellows Vincent A. Lacey, Frank R. Mensel, Mary Allen Jolley, David S. Murphy, James E. “Skip” Dotherow, Michael A. Kennamer, Kristie R. Rankin, John Petrovic; and E.P.C. Research Associates Michael S. Malley Jr., Jon P. Koh, J. Lucas Adair, Anna Ramia, Undre Phillips, Aubrey Stewart, Nelson Tidwell, Phillip D. Grant, and R. Matthew DeMonBrun, Ph.D. Student, Higher Education, University of Michigan.
